

Makes Website Authoring Easy

How We Do It

No matter how you create your website content, Revize *ONLINE* easily transforms it into HTML, empowering you to update or change your website, regardless of your web authoring skill level. Since **Revize *ONLINE*** is a publication based software, the system's architecture makes it easy to add to and update pages or create new ones. Simply copy and paste text into any template and **Revize *ONLINE*** will do the rest for you.

If you are a website developer, you can utilize any web page development tool including native HTML to define your website. However, **Revize *ONLINE*** includes a Dreamweaver Extension that extends the power of the industry leading web development tool and encompasses the entire Revize Web Developers' template creation processes.

This means that regardless of the tool used, the Web Developer identifies which content will be changed by your content providers, from simple paragraph text to complex indexes of links, and then establishes "placeholders" for the content that will be added/maintained by the content providers as assigned by you in Revize security model.

While both templates, or structure/presentation, and content are stored in the Revize embedded database, or a third-party database if you choose, they are separated, thus enabling either one or both to be easily updated at any time.

Interactivity

Through powerful application program interfaces (APIs), Revize *ONLINE* supports dynamic, visitor-driven functions and access to legacy/production systems and databases.

Revize *ONLINE* will generate, or re-generate, web pages whenever templates or content changes. Additionally, if a template must perform any visitor-initiated "dynamic" functions, such as log-in, search, access databases, etc., the template will contain the code, in HTML, .JSP, .ASP, .NET, etc., to perform the required processing.

Content contributors can also easily find and place video/audio clips, Adobe Portable Document Format (PDF) files, Macromedia® Flash® (SWF) animations and Windows Media clips into template-based structures that have been pre-defined to reflect the look and feel of your website.

This means that by utilizing Revize *ONLINE* your website will operate with state-of-the-art features and look among the most impressive on the Internet.

Missteps Forgiven

Revize *ONLINE* enables rollback to previous versions of web pages.

This is an important feature because for a variety of reasons contributors often must recover and republish previously created web pages. **Revize *ONLINE*** supports this essential feature. Similarly, **Revize *ONLINE*** provides many other critical and useful features, including: content and web page versioning; scheduled publishing and expiration; global workflow; audit trails; search engine application; and attachment of metadata such as key words, titles and descriptions.

We Are the Developers

Wouldn't you rather work with the experts? After all, we have been in the CMS business since it originated and we are the developers of Revize CMS.
