

Speedily Launch Content Management Projects

How We Do It

Uniquely, the Revize *ONLINE*sm content management system uses specially designed edit forms that reflect the *look & feel* of your website. And, you can have one edit form through which *all objects* on a web page can be edited, such as: text, images, files, links and new pages.

Why is this important? The ability to present information as it is viewed on the web page is an important advantage for non-technical people because they can see what they are about to change in the context of the web page. Once the change is made they immediately see the results of their work and editing then becomes both less formidable and a more acceptable task, speeding the content management project forward.

Often content management projects languish as content providers find it hard to use editing interfaces. But, Revize *ONLINE* contextual edit forms provide an important *ease-of-use* advantage. Other software applications require user interfaces to which your non-technical people must adapt or application software, such as Microsoft Word, which does not provide your website *look & feel*.

Revize *ONLINE* contextual edit forms can literally be fill-in-the-blank forms using style sheets with simple-to-use wizards to upload images and files or add links and new web pages. Further, because these edit forms are developed through the Revize Dreamweaver Extension, edit forms are easily created, giving sophisticated content editors greater power, latitude and control over their content.

Ensurance

Critically, Revize *ONLINE* comes complete with an embedded, production SQL database, application server and web server requiring only a standard client browser for all user interfaces and capabilities. All software is integrated making system administration and maintenance simple because everything is designed to work together for you.

Additionally, the Revize *ONLINE* publishing technology increases reliability and availability thereby improving *visitor* response time.

Revize *ONLINE* also provides a full set of powerful application program interfaces (APIs) which will enable you to add customized functionality to your website and web applications. Through these APIs you can provide dynamic capabilities at the time a web page is visited, such as log-in, legacy database access, processing, reporting and exporting data.

Why is this important? Hundreds of installations, across a multitude of industries, nonprofits and governments have proven Revize *ONLINE* works smoothly and easily. It's your ensurance that Revize *ONLINE* will work for you, too.

We Are the Developers

Wouldn't you rather work with the experts? After all, we have been in the CMS business since it originated and we are the developers of Revize *ONLINE*.
